Uveitis is a wide range of inflammatory diseases of the eye, specifically the uvea. There are 3 basic layers of the eye: the sclera and cornea on the outside, the retina on the inside, and the uvea in between. The uvea is composed mostly of blood vessels and connective tissue, including pigmented cells. The different parts of the uvea are the iris in the front, the ciliary body in the middle, and the choroid located behind these, which lies around most of the eye.

Uveitis is a heterogeneous group of disorders characterized by inflammation of intraocular structures. It is typically grouped into anterior uveitis (iris and angle), intermediate uveitis which affects the vitreous, and posterior uveitis which affects the retina.

Massachusetts Eye Research and Surgery Institution Ocular Inflammatory Disease Review of Systems Questionnaire This is a confidential survey. Please respond to all questions by circling the proper answer. Please bring with you to your appointment.
